

Patent Application of Richard Fields for "Magic Light
Illumination for Handbags"

ABSTRACT

A small light source for handbags which is to be sewn inside the handbag with a zipper accessible compartment. The light circuit consists of thin plastic coated wires, an AAA battery and a battery holder with On/Off switch, a flat light bulb with plastic covering and a normally closed Reed Switch magnet. The wires for the circuit are of a flexible material so that it can be repeatedly bent without harm. Circuit is designed (when battery holder switched on) so that each time the Reed Switch magnet is pulled away from another magnet on the opposite side of the handbag, the light circuit turns on. As the Reed Switch magnet comes into contact with another magnet, the light circuit turns off.
